"If permitted, the Gateway Pacific Terminal will generate a massive increase in trains traveling through the region. The environmental impact study on this project needs to consider the following questions and concerns from communities along the way.

What is the cost of infrastructure needed to prevent increased train traffic from imposing devastating impacts on local businesses and public safety?

Who will pay for that infrastructure: local taxpayers or the rail companies, coal companies and their Asian customers?

What are the air quality and public health implications of dozens of coal trains passing through communities?

How will massive increases in coal train volume on rail lines that are already at or near capacity affect other shippers, including agricultural commodities that currently move approximately 40 million tons per year to ports in Washington and Oregon for export markets?

How will increases in coal train volume affect Amtrak passenger service through the Pacific Northwest and the vital tourism economy of the region?

How will increased coal related train traffic affect existing businesses near the railroad in towns and cities along the route?

I urge the Army Corps of Engineers to conduct an area-wide Environmental Impact Statement that includes Montana and Wyoming to assess the cumulative impact of coal export facility proposals."
